

Conclusion

This patent application describes a comprehensive system for continuously reweighting a machine learning model's parameters with integrated modules for audit verification and content differentiation. By distinguishing between subjective opinions and verifiable, action-backed statements, the system ensures that only fact-based information exerts significant influence over the model's internal representations. This approach not only adapts to evolving data streams but also actively filters out recycled or sensationalized content, maintaining alignment with verified truths. The resulting "living and breathing" system continuously absorbs new data and validates its outputs against objective benchmarks, ensuring both responsiveness and factual accuracy.
