

Title: "Systems and Methods for Secure Controlled Information Retrieval Using Artificial Intelligence and Biometric Authentication"

Abstract

This patent describes a system and method that integrates AI-driven natural language processing with biometric authentication, specifically facial recognition, to provide secure, role-based access to sensitive information. The system dynamically adjusts response content based on the user's access level, determined through a combination of facial recognition and access credentials. This approach ensures compliance with privacy policies and restricts information output to only what is appropriate for the authenticated user.
